

# Stormwater: Know Where It Goes

When it rains, the water that runs across our yards and roads into storm drains is called stormwater.

Storm drains carry untreated stormwater and whatever the water picks up directly to creeks, lakes and rivers.

If we want to keep our rivers and creeks clean, we need to keep chemicals, oil and other pollutants out of our storm drains.

Stormwater is our biggest source of water pollution.

And you're the solution now that you know where it goes.
